

Case Study | m2e in Oil & Gas

SUPPLY CHAIN MANAGEMENT CLOUD APPLICATION

Client Overview

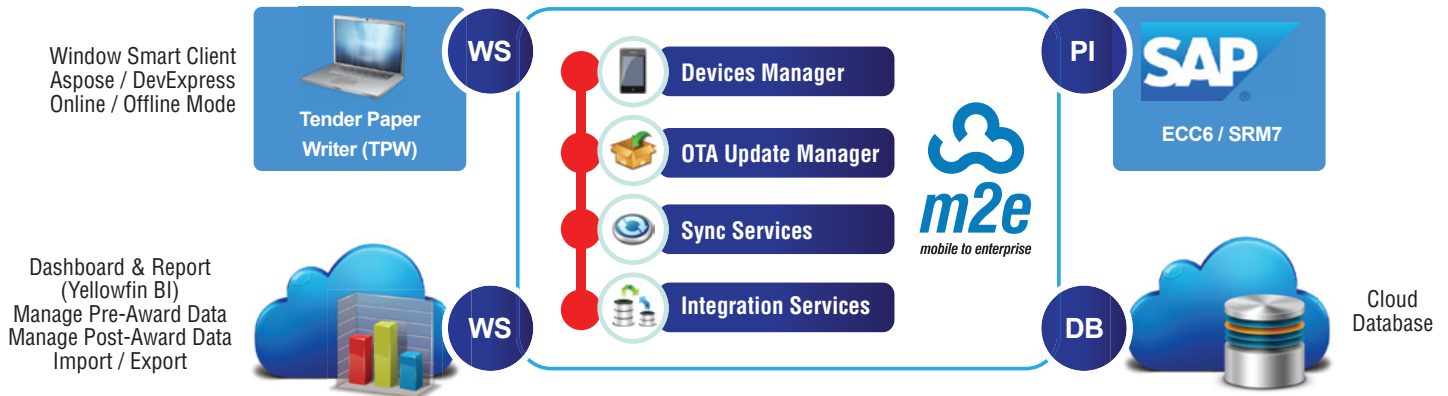

Oil and Gas Exploration and Production Corporation with revenue of RM 300 billion. It works alongside a number of multinational corporations through production sharing contracts (PSCs) to explore, develop and produce oil and gas in Malaysia. It also engages in well drilling, engineering, constructing and commissioning of natural gas pipeline and associated facilities.

Challenges

As a large exploration organization, the Supply Chain Management (SCM) is a critical part in supporting the entire spectrum of the exploration activities. The SCM team was looking at automating the creation of bid and contract documents which are currently being created using MS Word and Excel. There were also concerned about data integrity because of the many different versions of the data files within these documents.

Additionally, the SCM team wanted the capability to response in real time to any enquiries by management. The current process is very time consuming because data needs to be compile from different sources.

The Solution – A Cloud based Supply Chain Management

SCM Cloud Application

The first module - Tender Management, is used to manage Pre-Award Tender Information allows the user to manage and track all activities during tender stage from initiation to completion as well as the ability to check Tender Status. The second module - Contract Management, allows management of Post-Award activities such as manage and track activities/status during the contract stage. The final module - The Business Intelligence module is used to dynamically create reports and dashboards for senior management as well as the planning division to make informed decisions based on real time information provided.

m2e Integration service

m2e is an enterprise application integration (EAI) that integrates to the SAP system to pull contract management data and update into the centralized private cloud. The sync service feature will synchronise Tender management data between TPW and the cloud database. The patch management module of m2e will enable the administrator to push new TPW patches to be updated in different regional offices.
